

### Exercice 6

$$\begin{aligned} a) \quad |z|^2 &= \bar{z} z = (x+iy)^2 \\ &= x^2 + 2ixy + (iy)^2 \\ &= x^2 - y^2 + i 2xy \\ &= P(x,y) + i Q(x,y) \end{aligned}$$

$$\text{car } P(x,y) = x^2 - y^2 \text{ et } Q(x,y) = 2xy$$

Remarquons que les dérivées partielles existent et sont continues, note à examiner les équations de Cauchy-Riemann.

On a :

$$\textcircled{2} \quad \frac{\partial P}{\partial x} = 2x \quad \text{et} \quad \frac{\partial Q}{\partial y} = 2x$$

$$\text{donc} \quad \frac{\partial P}{\partial x} = \frac{\partial Q}{\partial y}$$

$$\text{et:} \quad \frac{\partial Q}{\partial x} = 2y, \quad \frac{\partial P}{\partial y} = -2y$$

$$\text{donc} \quad \frac{\partial Q}{\partial x} \neq -\frac{\partial P}{\partial y}$$
